function definition

keyword   **function name**   **Parameters**
                                  placeholders   **default value**

```
function calculateBill(meal, taxRate = 0.05) {  Scope
                                                 Start
    const total = meal * (1 + taxRate);              function
                                                     body
    return total;   return
                    statement
}  Scope
   End
```

variable to capture
returned value   **name or reference**   **call, run or invoke**

```
const myTotal = calculateBill(100, 0.13);
```
                                    Arguments
                                    actual values

sync, generator, ...rest and other ways to define a function not included.
